

Data Supply Chain Certification

DQWG11 - Eivind Mong

Agenda

- Data Quality Definitions

© Michael Bergmann, 2016

- Data Supply Chain Certification

1. Data Quality Definition

The diagram consists of four nested, horizontally-oriented ovals. From left to right, they are:

- Basic SD**: The innermost oval, containing a blue arrow pointing right.
- Voyage Centric Extension**: The second oval, surrounding the first.
- Sensor Error Budget**: The third oval, surrounding the second.
- Data Error Budget**: The outermost oval, surrounding the third.

 The ovals are shaded in a gradient from light blue to dark blue. The entire diagram is enclosed in a purple grid border.

Situational Awareness

Safeguarding needs enhanced Support

- Increasing complexity of nautical task**
 - Higher traffic volume and densities
 - Reduction of navigable space
 - Larger ship size
 - Reduction of bridge teams
 - Economical and ecological pressure
- Increasing data volume**
 - Higher number of situation relevant data types
 - More data sources (sensors, other ships, shore...)
 - Higher resolution of data provision (spatial, temporal)

➔ Necessity to prepare information

- Selecting and linking of relevant data
- Evaluation and refinement of data
- Human Centric Approach for presentation of information

Situation Awareness

Data are the key element !

- Data needs to be converted into information.
- Human Centered Design (HCD) intends to present information in digestible way.
- High error budgets in database cannot be rectified by the best systems.
- Data quality needs to be a prime focus area.

Predicted error budget (meters)

Parameter	Est. StDev.
GCP error	1.00
Residual processing	0.50
Residual satellite	3.60
Feature capture	0.40
Terrain induced error	2.45
Est. Total error	4.51

Example

QuickBird is a high resolution satellite owned and operated by DigitalGlobe

Lima, Peru

5

Reliance of Ship's Navigation

Navigator vs System

Michael Bergmann, HSSC7, 12 Nov 2015

6

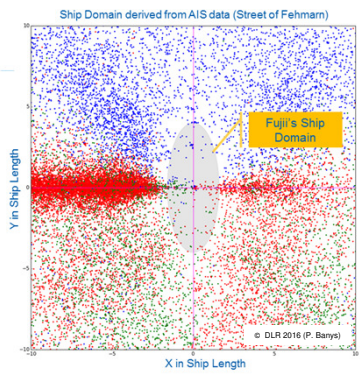

Avoidance of Collision & Grounding

dCPA/tCPA, Ship Domain (SD), and Ship Arena (SA)

- Open Sea Conditions**
 - dCPA/tCPA are usual identifiers of collision risk between ships
(distance/time to Closest Point of Approach)
 - SD is the safety area around a ship not to be violated (ships and obstacles)
 - Diversity of SD models result from determination & considered impacts (object of research)
 - SA describes the area around a ship to be monitored for SD protection (taking into account the needed time for collision avoidance actions)

- Restricted Waters, Port Entries, Narrow Fairways,....**
 - dCPA/tCPA approach unusable due to restricted navigation area
 - Special SD taking into account specific conditions & maneuvers (navigational area and maneuver possibilities)

Ship Domain derived from AIS data (Street of Fehmarn)

Dimension of Ship Domain

Influencing Factors

Ship Centric factors

- Ship size (length, width)
- Ship's static characteristics (wind susceptibility)
- Ship's dynamic characteristics (maneuverability...)

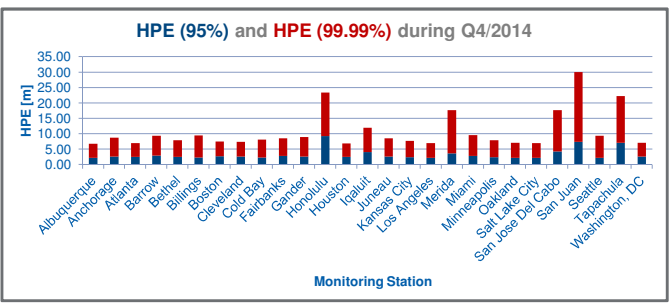

Voyage Centric Factors

- Cargo: dangerous goods
- Passenger
- Speed

System Centric Factors

- Human factors (navigator education, experience...)
- Ship Sensor error budget
- Data error budget (data quality indicator, CATZOC...)
- Data Supply Chain error budget

Example of error budget:
HPE of GPS SPS

Monitoring Station

HPE: Horizontal Positioning Error
GPS: Global Positioning System
SPS: Standard Positioning Service

HCD and SQA Guidelines

Reducing system error budget

HCD (Human Centered Design) and SQA (Software Quality Assurance) Guideline recommends standards for system quality to reduce system error budget

e-navigation quality design attributes

Managed through a Quality Management System

IMO Guidelines on Human Centred Design and Software quality assurance (SQA) in e-navigation

- It addresses need of data quality but doesn't specify data quality standards

Determining the dimension of the individual Ship Domain

(1) Ship's size & characteristics define the dimension of the basic domain.

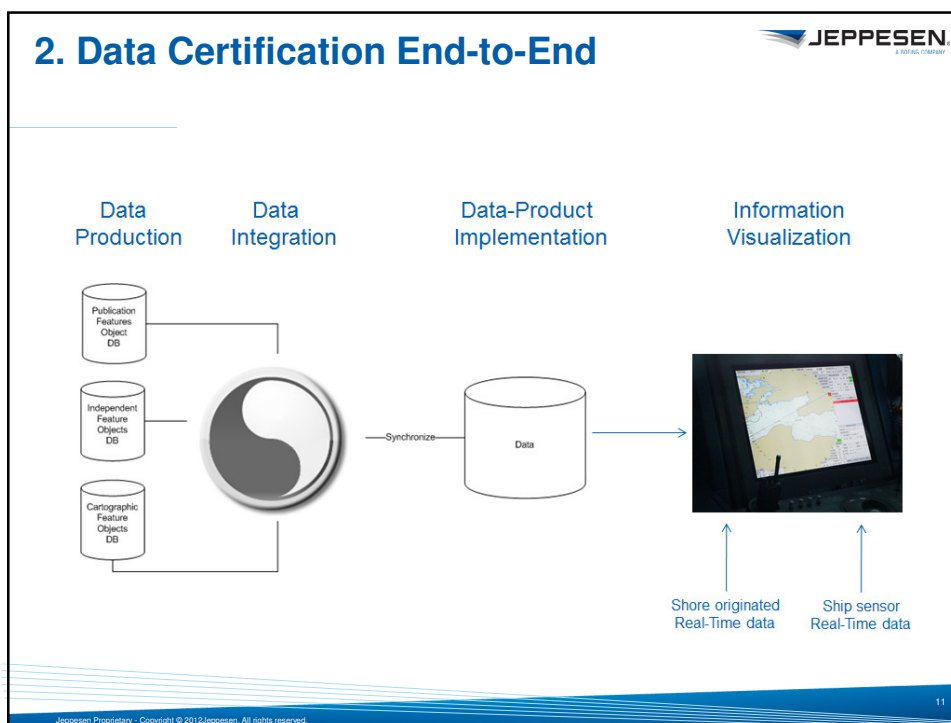

(2) Voyage centric factors are increasing the basic risk and require an extension.

(3) Each component used for decision support (Radar, ARPA, Compass, ENC's...) contributes to SD's confidence.

(4) In integrated systems (ECDIS, INS) the data error budget may be accumulative.

Data Quality at e-Navigation Systems

Part of the Guideline

3. Definitions

3.1 Data Quality: The degree to which quality characteristics of data have the intrinsic potential to satisfy stated and implied needs when data is used under specified conditions. It also refers to the degree to which data quality is reached and preserved within a computer system when data is used under specified conditions.

3.2 Data Quality Assurance (DQA): A set of processes, that ensures that shore and shipboard based data used by e-Navigation systems meets and complies with required quality specifications. It is recommended that DQA is performed using a quality management system such as ISO/IEC 90003:2014 or relevant standards.

IMOs position on data Producers:

5.9 Producers of input data should have lifecycle management practices in place to handle possible data format changes during the lifecycle. These lifecycle management practices should include timely announcements to software producers and end users about such changes. As part of the DQA producers of input data should test all data in service for conformance with relevant international standards. (MSC.1/Circ.1512)

Further IMO Specifications:

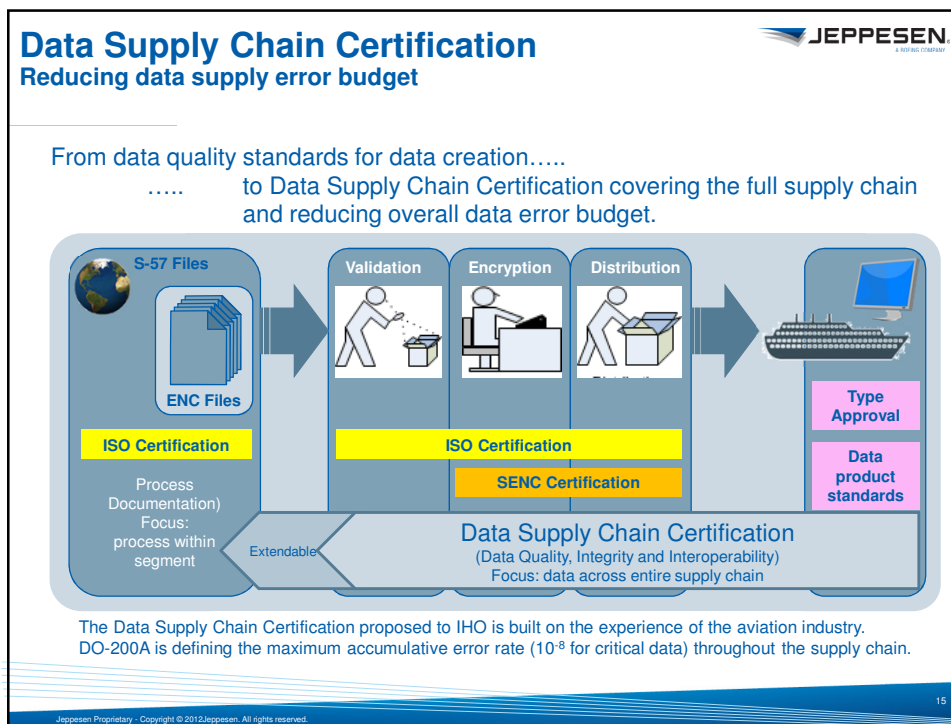

5.7 Software quality is also dependent on the quality of input data, which should conform to relevant international standards. ... (i.e. ... IHO standards for nautical information including Electronic Navigation Charts (ENC))...

5.8 A systematic approach to ensure data quality is recommended, and can include:

defining and evaluating data quality requirements in data production, acquisition and integration processes;

(MSC.1/Circ.1512)

A reminder: Data Supply Chain Certification at IHO

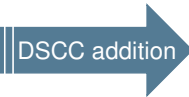

Presented at WEND 11, 2008

- Presented at CHRIS 20, 2008
- Both invited members to participate in a correspondence group
- HSSC1 invited further work from the DSCC-CG and invited it. (HSSC2 Action 2)
- The DSCC-CG had 36 members from HOs, IHO-WGs, related organizations and experts
- A draft of a Marine version of DO-200A has been developed and distributed to the DSCC-CG

Maritime Data Quality Aspects

Based on RTCA DO-200A in Aviation

1. Accuracy
2. Resolution
3. Assurance Level
4. Traceability
5. Timeliness
6. Completeness
7. Format

Data Integrity throughout the Supply Chain

Suggestion from an Industry viewpoint:

- A coordinated approach to DQA under the leadership of IHO in partnership with Industry and other key stakeholders
- Utilizing the work of the CG-DSCC
- Taking into account:
 - Data quality aspect
 - Data security aspect
 - Supplementary data aspect
