

# Needs and Challenges in Industry

## Environment and Engineering

by

**Dr Mike Osborne**

Managing Director, OceanWise

Metocean Advisor, Premier Oil

UK Representative on UN-IOC Caribbean Marine Atlas Project

# Offshore Development

All stages of marine and coastal development require access to:

- Comprehensive accessible fit for purpose data
- Quality assurance, confidence levels and provenance
- Data processing and management tools
- Presentation and dissemination tools
- Expert knowledge on:
  - information management
  - marine data standards
  - specifications for data acquisition
  - data QA, analysis and GIS

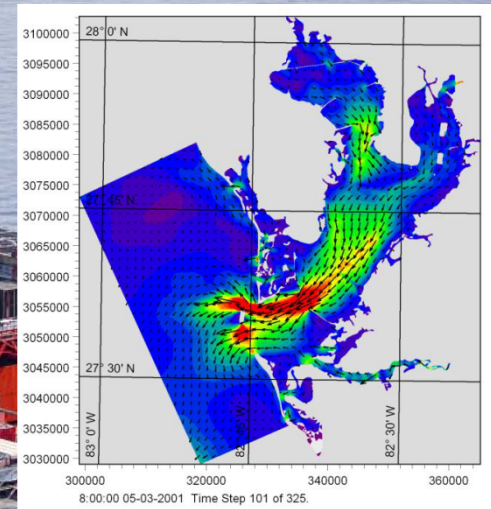

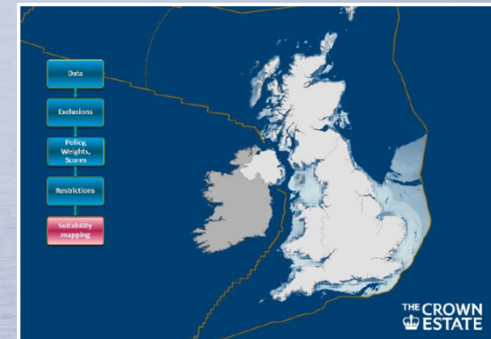

# Offshore Renewable Energy

# Oil & Gas Exploration & Production

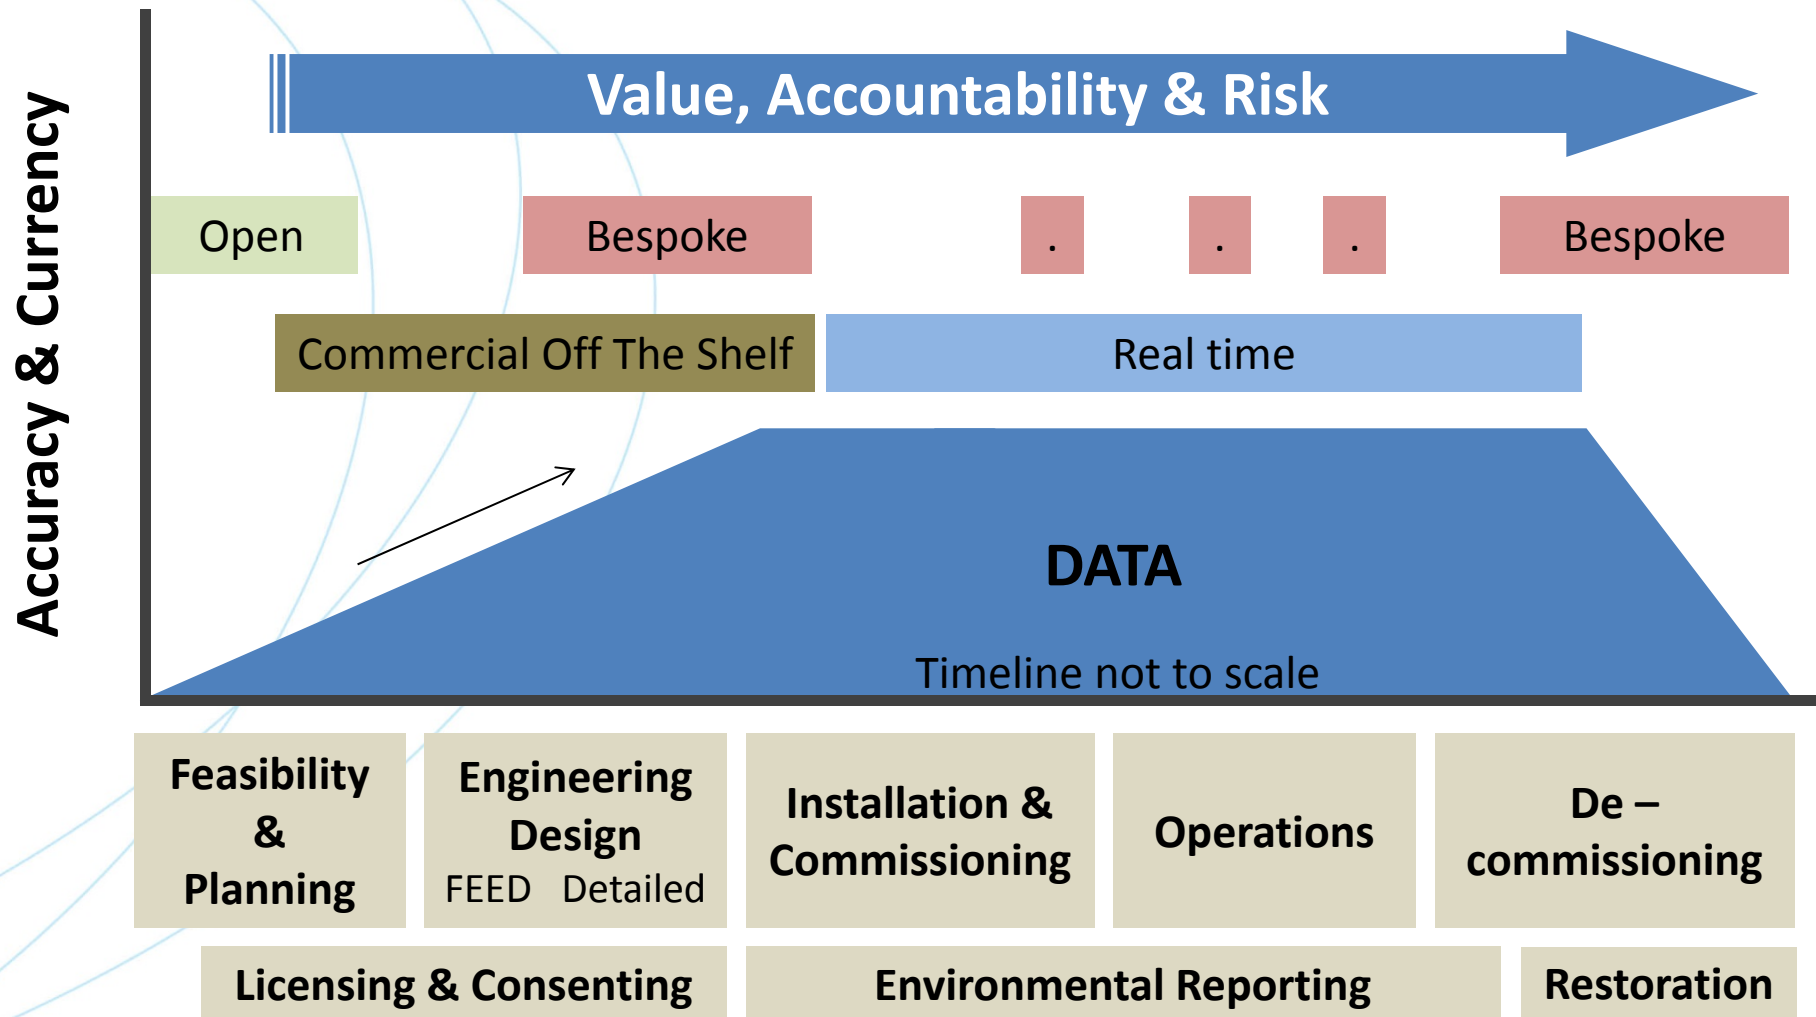

# Coastal Engineering

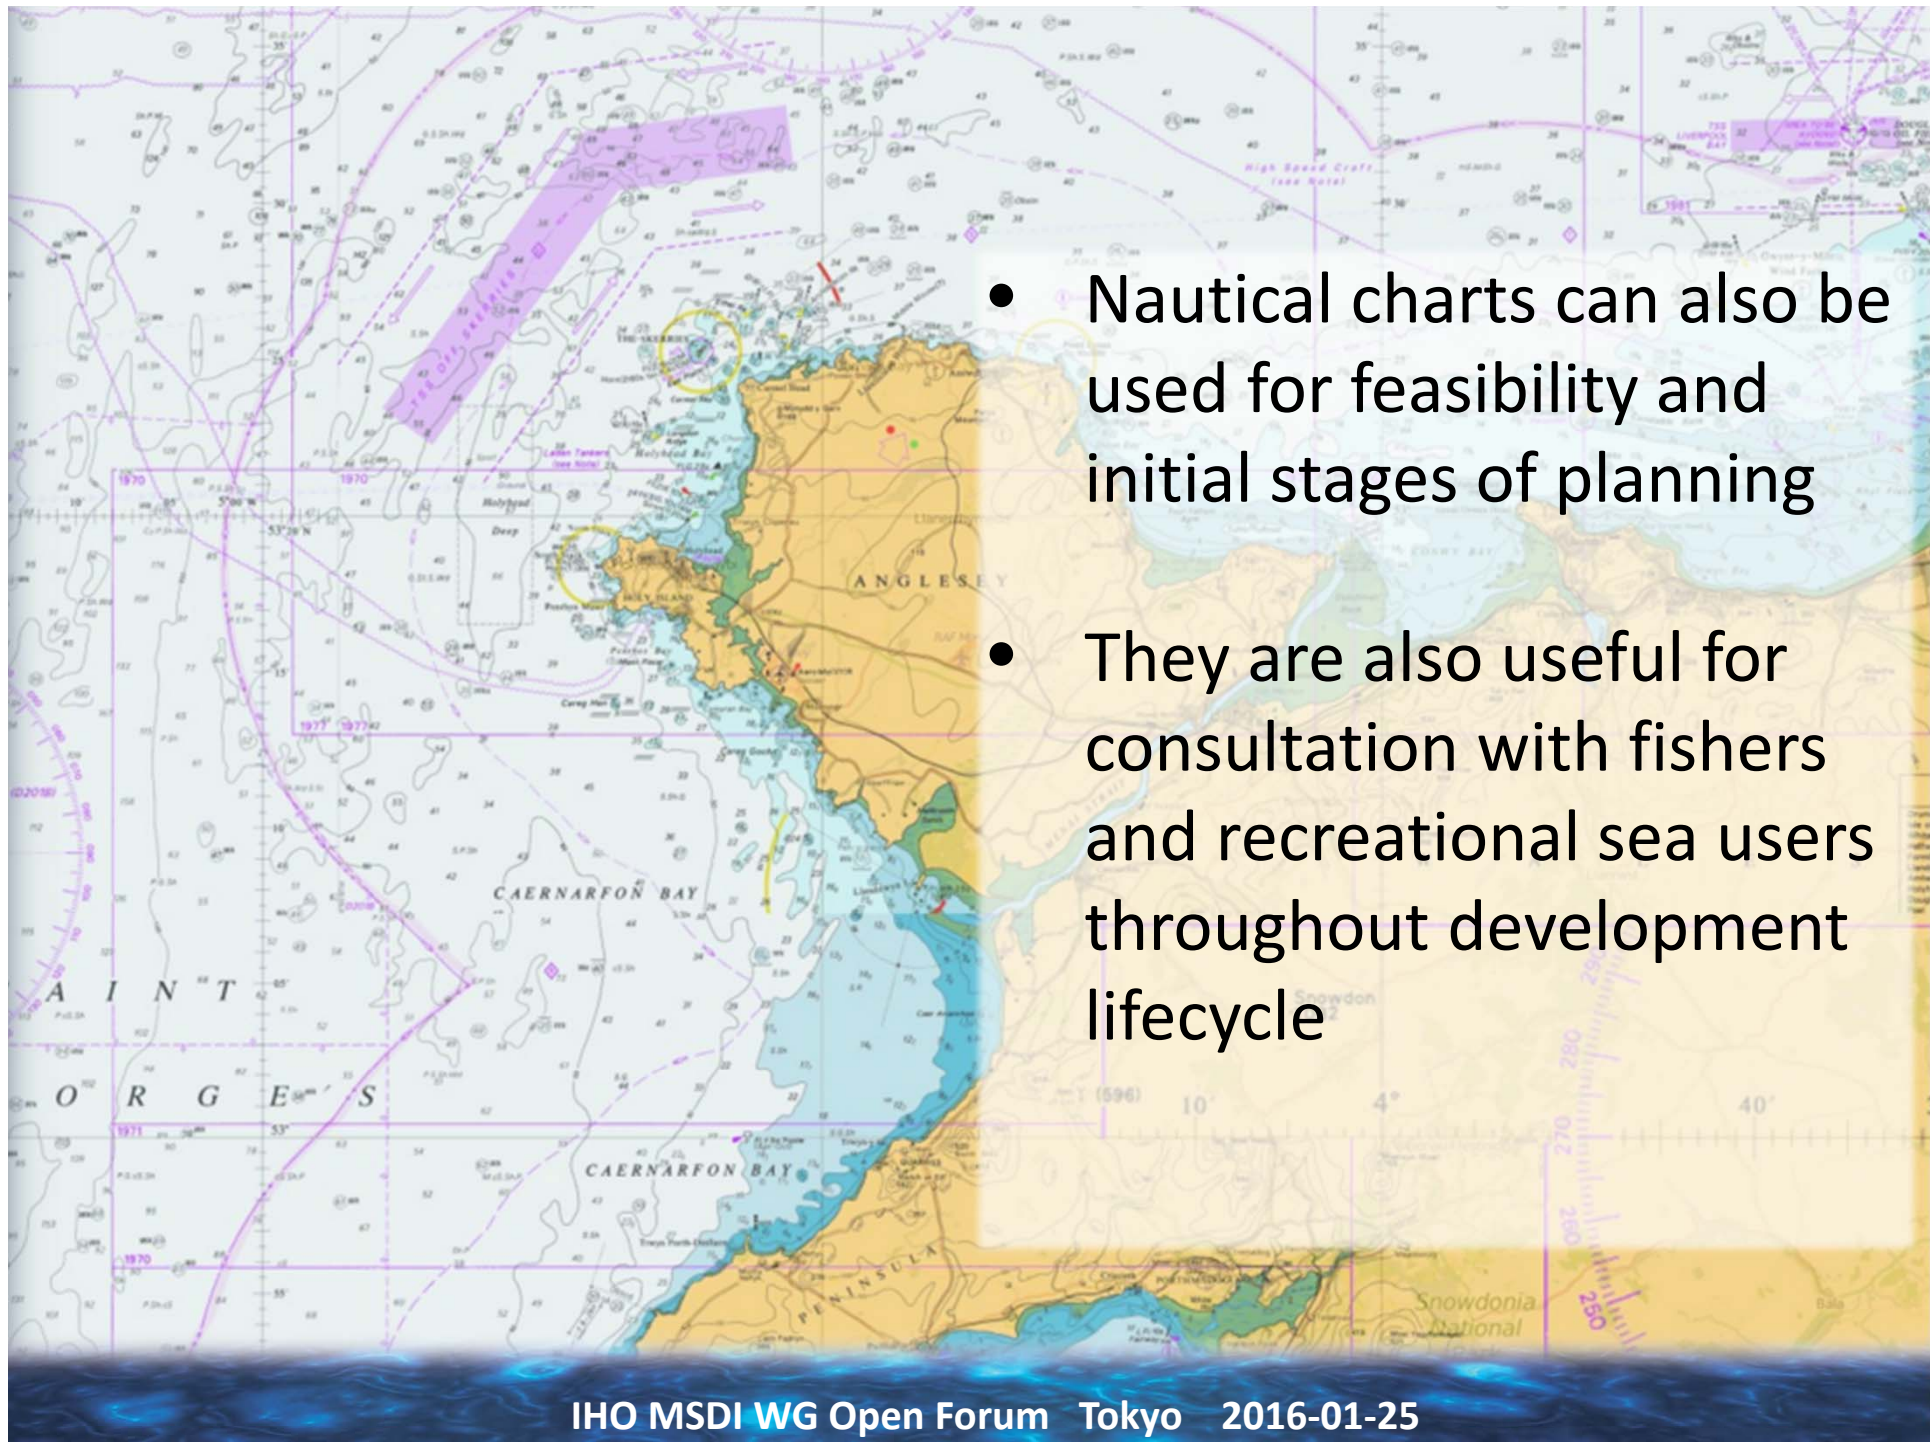

# Typical Development Lifecycle

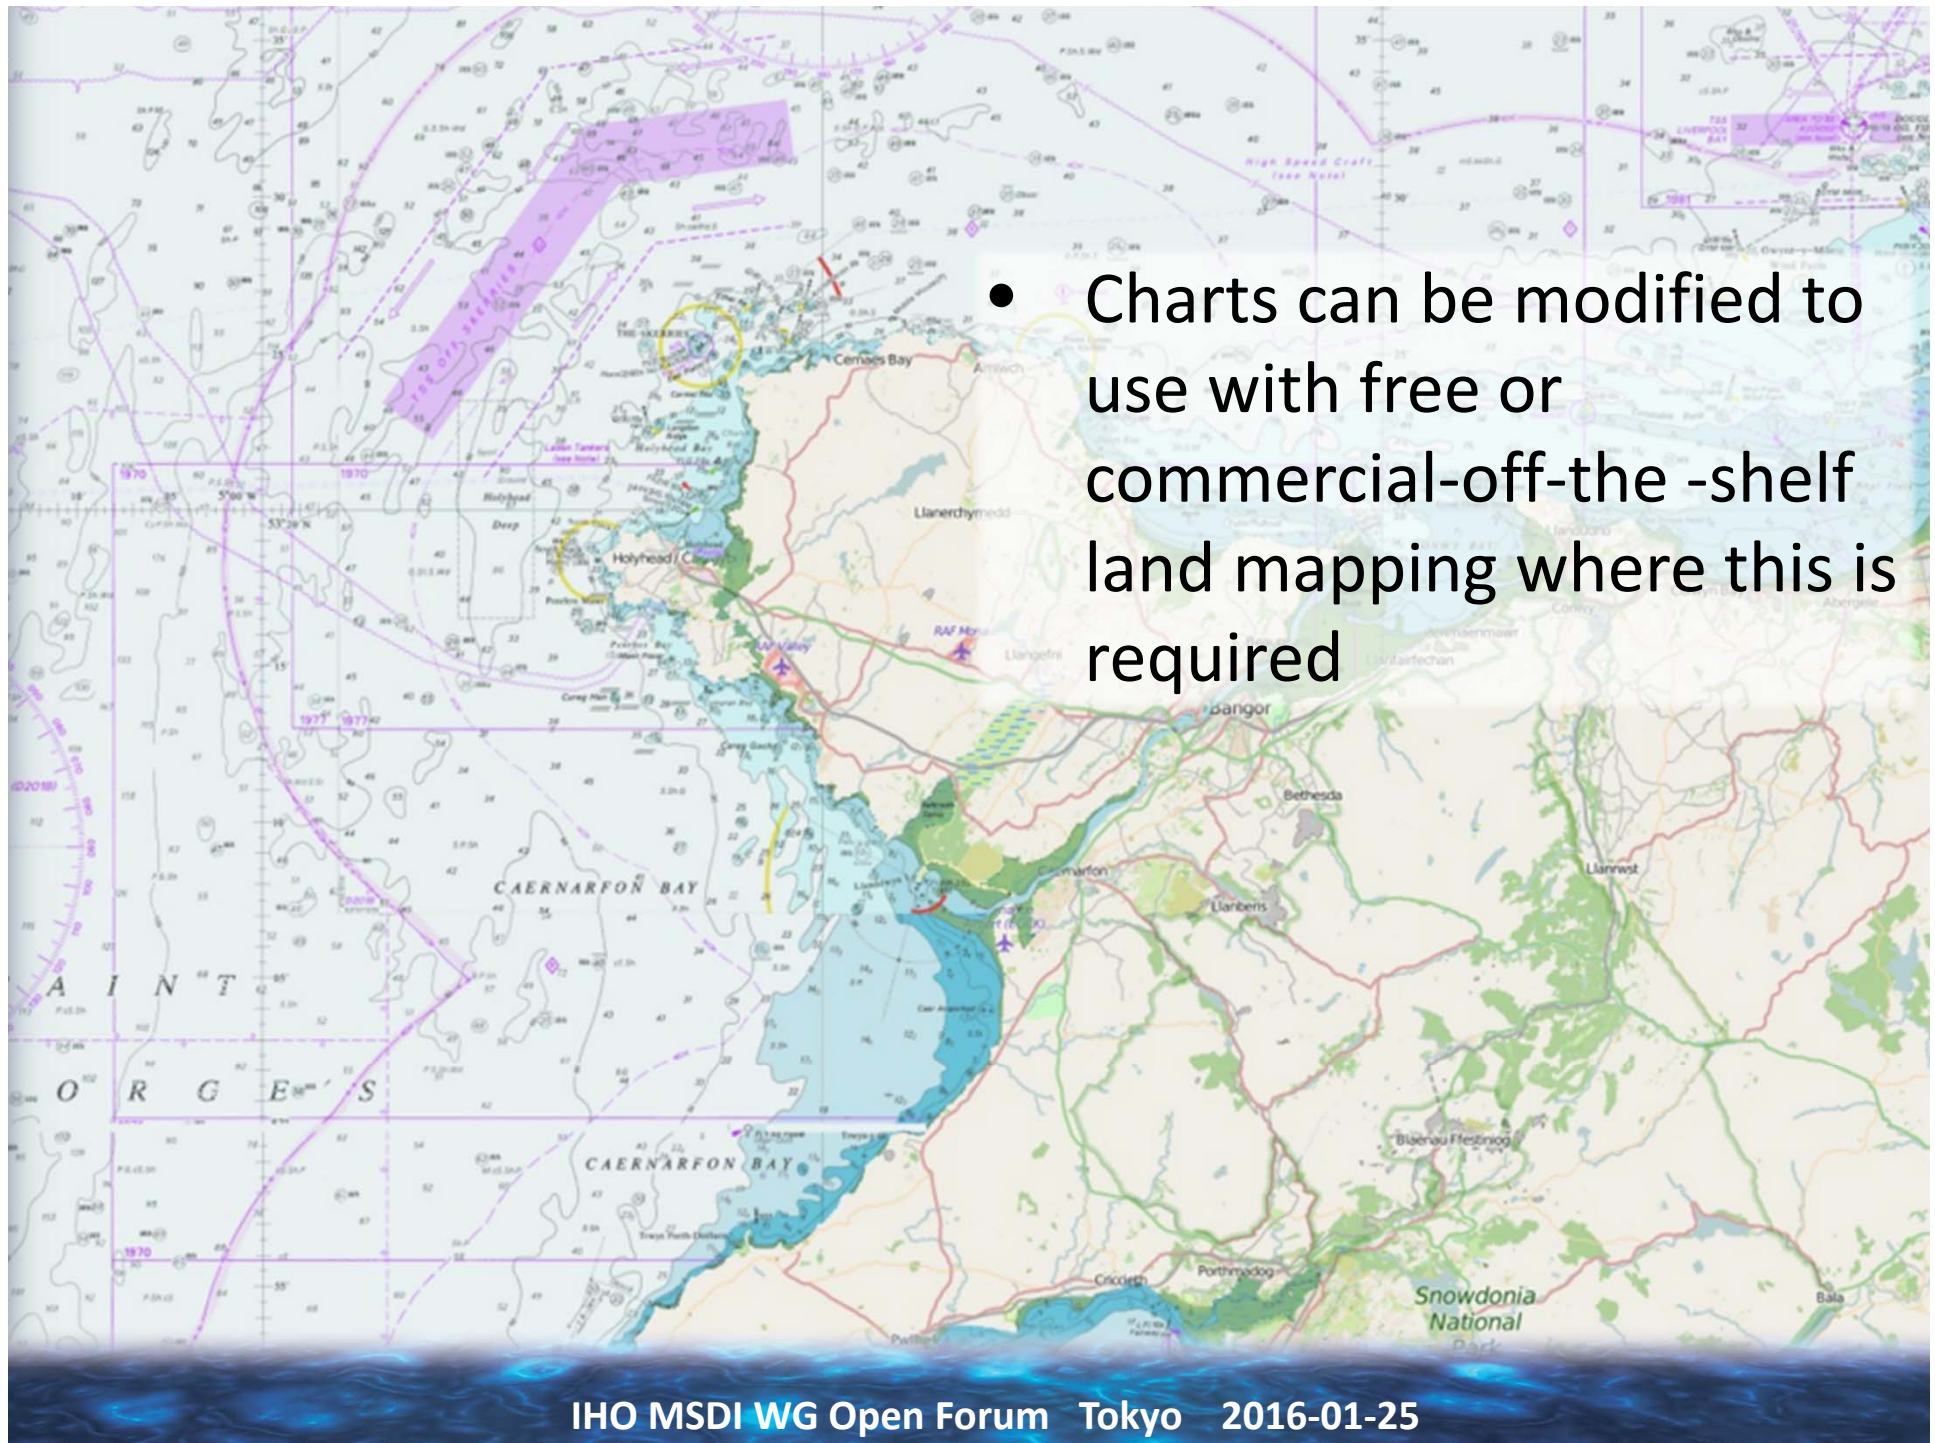

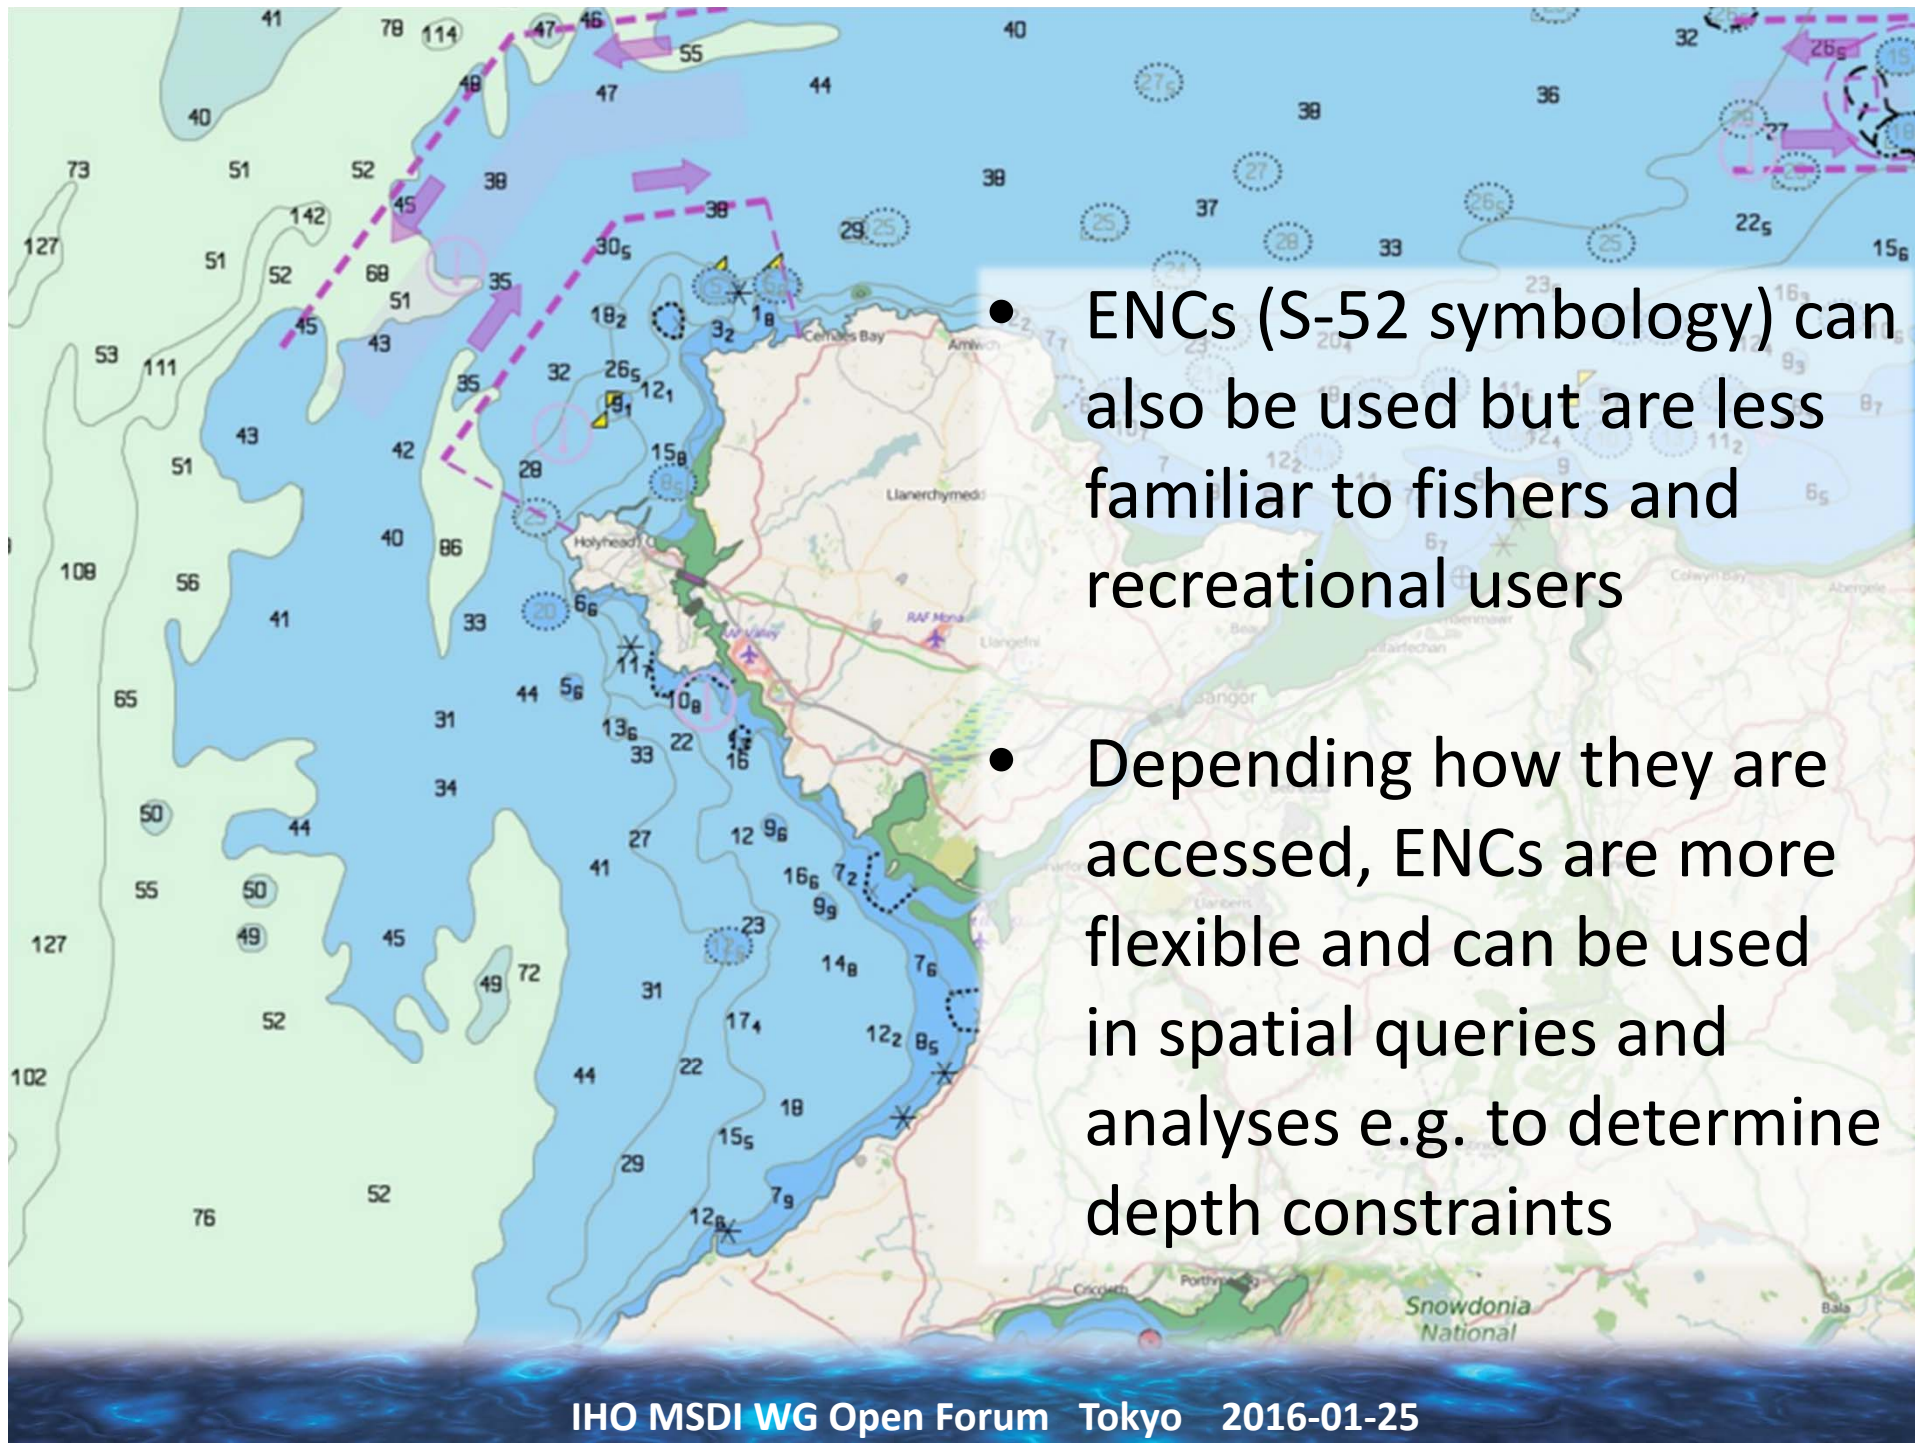

- Nautical charts can also be used for feasibility and initial stages of planning
- They are also useful for consultation with fishers and recreational sea users throughout development lifecycle

- Charts can be modified to use with free or commercial-off-the-shelf land mapping where this is required

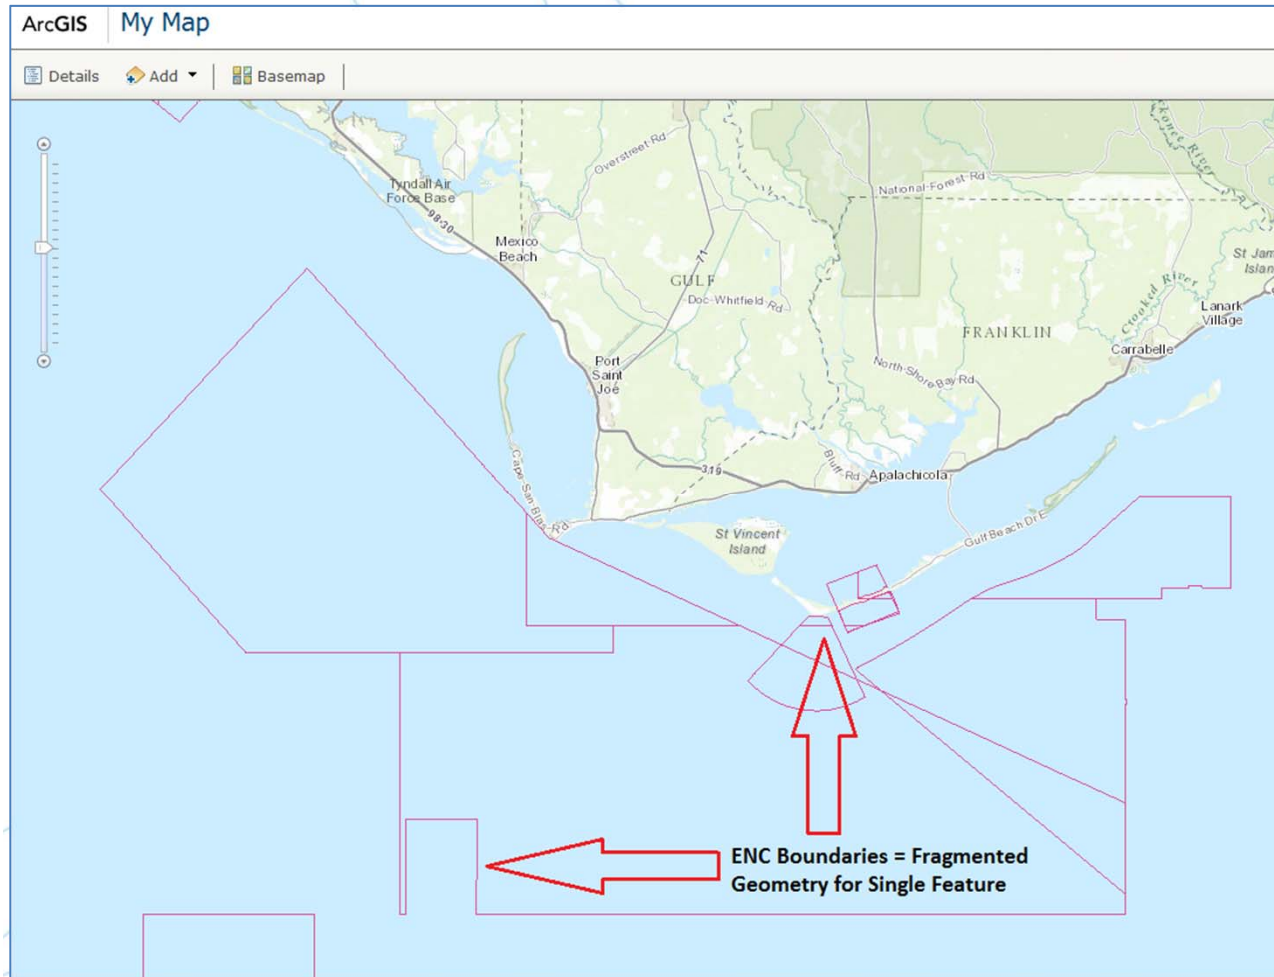

- ENCs (S-52 symbology) can also be used but are less familiar to fishers and recreational users
- Depending how they are accessed, ENCs are more flexible and can be used in spatial queries and analyses e.g. to determine depth constraints

# However ENC and Chart Derived Content can be an Issue

- US Marine Planning Portal (accessed 2014)
- S-57 Objects used as captured with fragmented and incomplete geometry
- Better to have used source data directly  
or
- Create source from re-engineered dataset e.g. Marine Themes

- ENCs are navigational products designed for a particular purpose
- Charts have features omitted e.g. non significant cables and shipwrecks
- Charted depths are shoal biased
- Charts have to be safe!
- The terms and conditions of use in GIS and Desktop GIS - the tool of choice for developers - is at least open to interpretation (or deliberately ignored)
- Workarounds to licensing conditions exist and always have – e.g. I was digitizing paper charts for environmental modelling in the late 1980s
- **Better is for HOs to provide a *bona fide* alternative**

- **Data output in GML**
- **Links to S-57 FOIDS are maintained**

Property	Value

Miscellaneous	

**Chart boundaries are removed to create a seamless reference base to which other datasets can be linked**

**Seabed Digital Elevation Model maintained from de-conflicted high resolution survey data – SHOAL BIAS IS MINIMISED But may still be present IF survey data is thinned by retaining only the shoalest sounding**

**Marine map is combined with 'fit for purpose' land mapping**

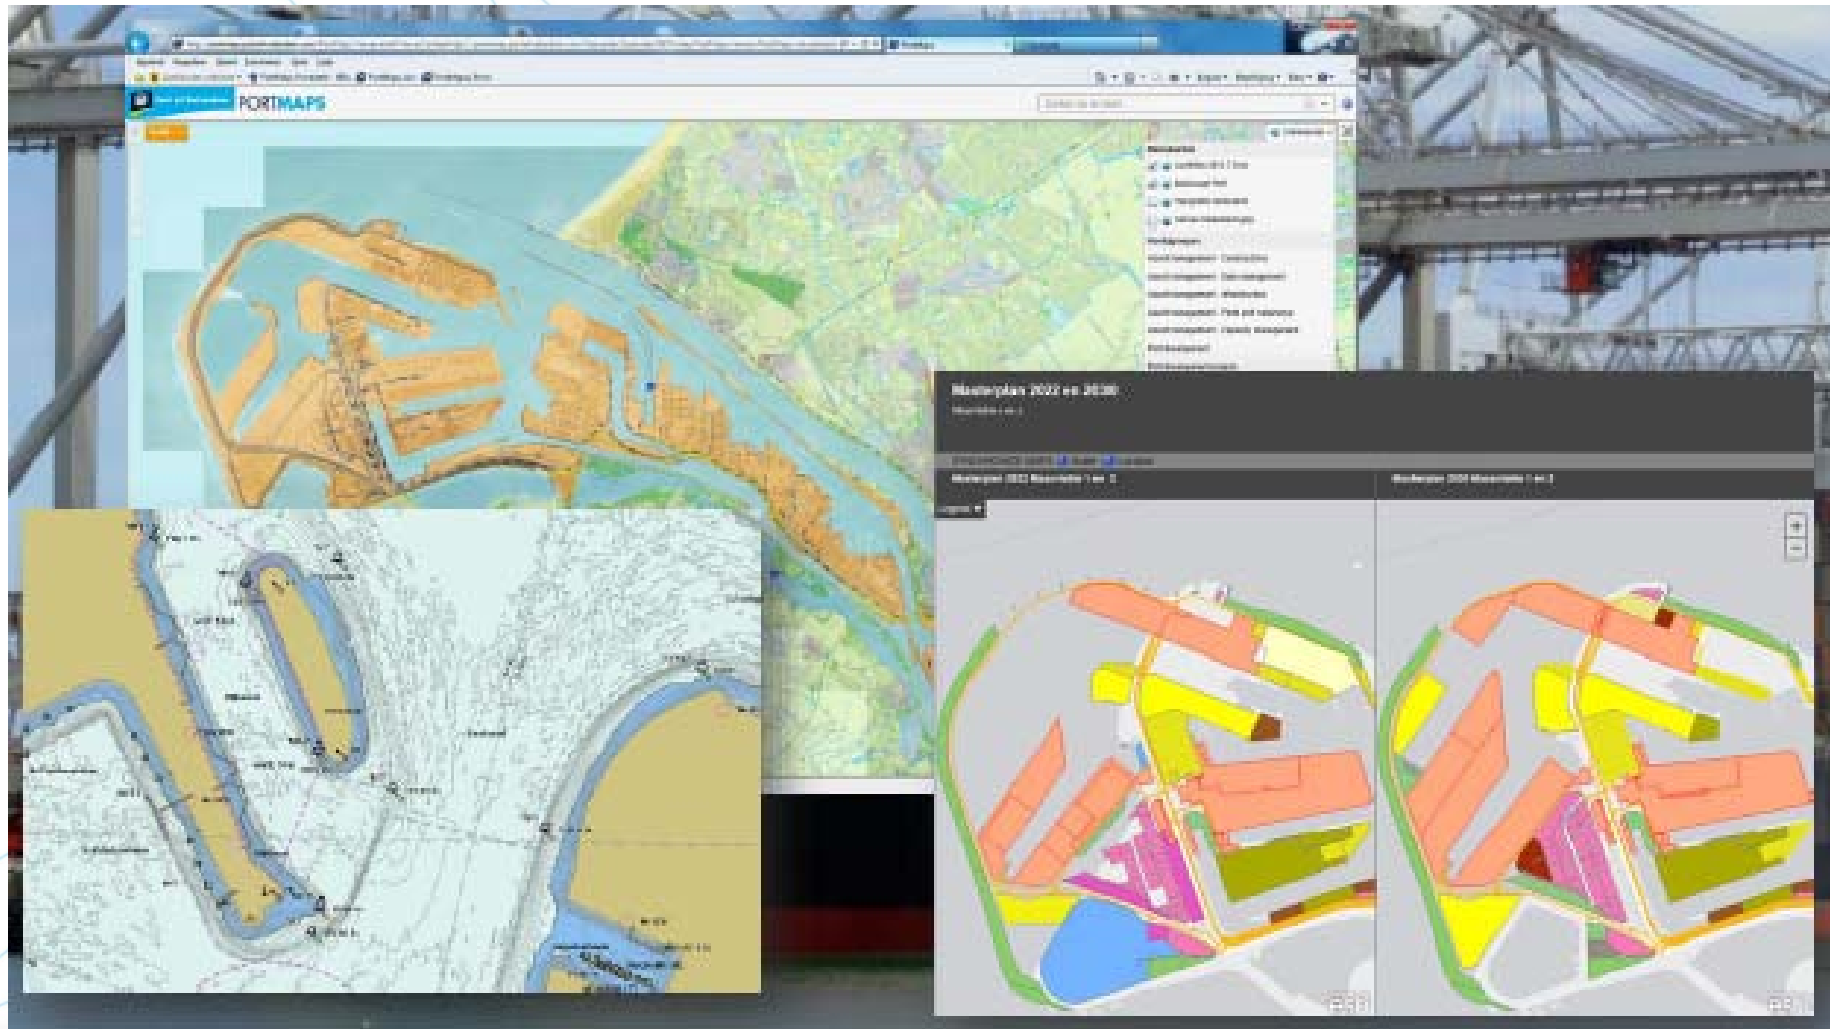

A decorative graphic on the left side of the slide, consisting of several overlapping, curved blue lines that resemble waves or a stylized 'C' shape.

# Is this the future for Navigation?

**ePilot in use in Marseille Harbour**

- Data layers via Web Services
- ENC's & MIOs
- Real Time Tides
- Vessel Tracking
- Uses standard browser i.e. no installed software
- Available on range of clients e.g. PC, Mac, iPad etc.
- Data can be cached for offline access

## Is this the future for Navigation?

- The HO may not be the primary source for the data used in nautical charting
- Navigational service providers accessing data from various sources and delivering direct to vessels over web services (cached where necessary)
- Sources such as weather, ship routing, traffic and logistical data can be included
- HOs can play a part in this fast developing geospatial matrix or they can continue to focus on a product which for many will become less relevant as more flexible alternatives become available

# I know what I would do!

VISION: A linked "DATA OCEAN" is coming soon!

	2016	2017	2018	2019	2020	...
1	Create Team	Create Working mechanism	Making Top Level Plan			
2	Making Teacher-Mentor Pairs & relative resource	Find developed Training Contents & Trainer	decide trainees (50/60K)	Trainee commitment		
3	Create regulation	Find the experts who know Standards & English & Communication Skill	Working in the International Working Group (e.g. IHO)	Developed the Standards under specification		
4	Choosing Infrastructure Location	Decide "what DATA is OPEN?"	Sharing Cost (Decide)	Development S/W, H/W		
5	Developed Deep Water Survey Capacity	Start Discussion of Military → Intelligence Agency	more coverage of DATA			
	ask Budget from Gov. Change our mode to DATA-centric	Perform DATA Management effectively				
	Classified & defined	Create Meta DATA DATABASE	Using Metadata to find the resource we need			

**“A linked DATA OCEAN is coming soon!”**
