

# **“Realising the benefits of Spatial Data Infrastructures in the Hydrographic Community”**

## **IHO MSDIWG Submission to the 1<sup>st</sup> Session of the IHO Assembly**

***“Change is hard because people overestimate the value of what they have and underestimate the value of what they may gain by giving that up.”***

James Belasco and Ralph Stayer: Authors of the “Flight of the Buffalo”

### **The purpose of this paper**

This paper should enable IRCC to discuss and report back to MSDIWG on the content of this draft prior to onward submission to the 1<sup>st</sup> Session of the IHO Assembly in April 2017.

### **Overview**

It is now ten years since the 4th EIHC, April 2007 adopted the Resolution that the IHO implement a Marine Spatial Data Infrastructure (MSDI) Policy. A Spatial Data Infrastructure (SDI) is the relevant base collection of technologies, policies and institutional arrangements that facilitate the availability of and access to spatial data<sup>1</sup>.

This submission to the IHO Assembly provides a resume of progress to date made by the MSDIWG, the role of the IHO in that time, external drivers to adoption of SDI and the expectations of Member States (MS) in adopting MSDI and data management best practise principles now and in the future. Assembly is requested to consider this submission and to extend the mandate for this IHO policy for a further ten years.

## **1. The Current Situation**

### **1.1. National HO’s as providers of authoritative foundational marine information**

Hydrographic Offices (HOs) have been providing navigational chart products and navigational services since the end of the 13th century! However, in the 21st century, HOs find themselves ideally placed to be the de-facto provider of specific authoritative foundational marine/maritime information<sup>2</sup> such as bathymetry, coast line and maritime administrative areas to a wider marine user community. The HO community globally has been rather slow to respond and engage in MSDI initiatives, whereas at a regional level, engagement has happened through the requirements of, for example; the EU INSPIRE and Marine Strategy Framework (MSFD) Directives which requires the creation of the European Marine Observing Data network (EMODnet).

HOs are now collecting data from new sensors; an example of this is Satellite Derived Bathymetry (SDB) and ingesting Crowd Sourced Bathymetry (CSB) data from new sources such as fishing and work boats. These methods provide a source of data in areas where existing data is poor or non-existent. Managing data is also an increasing challenge when set against the reality that 90% of all data has been created in the last 2 years with average business data volumes doubling every 14 months! Hydrography is now having to consider handling “big data”.

---

<sup>1</sup> Ref: Global Spatial Data Infrastructure (GSDI) Cookbook.

<sup>2</sup> This means data that can be used by most users most of the time; sometimes called “core reference” data.

Data manage data that is now much more widely sought by marine users to underpin decision support and asset management. The way such information should be delivered is through greater access to, sharing and re-use of data at an enterprise, national or regional level initially at the government to government level but also increasingly with commerce. This does not imply that data sharing should be cost free.

### **1.2. The role of the IHO**

The IHO strongly believes that its MS should be the “providers of choice” for authoritative foundational marine/maritime information through engagement and participation in MSDI in addition to their existing navigational role. It is actively strengthening its understanding and knowledge of the role of hydrography in MSDI through its outreach programmes with other SDI stakeholder groups (such as the European Commission, UN-GGIM, IOC-IODE), globally, and through the IHO MSDIWG across the HO community. The IHB is a great advocate of MSDI and the need for change stating, along with other stakeholders, that unless MS act quickly, others will provide the authoritative data and in doing potentially weaken the status of HO’s.

### **1.3. The role of Regional Hydrographic Commissions (RHC’s)**

The fifteen RHC’s, as the coordination and monitoring bodies that drive, communicate, encourage and promote the role of national HOs within their region of interest, have a responsibility to ensure that their Member States (MS) are equipped with the understanding, knowledge and mandate to take advantage of the support available to them through the IHO Capacity Building programme or by individual MS investing themselves in the necessary education, training and mentoring to meet new expectations for access to their data. RHC’s are tasked with coordinating reports of progress of MS in their engaging in / or leading of efforts to develop and / or engage in MSDI initiatives by reporting such activities as a standing agenda item at RHC meetings. Whilst an element of reporting is now routinely happening at most, but not all RHC meetings, it has not resulted in the anticipated engagement in MSDI initiatives. That said, recent developments with the Arctic SDI initiative and the planned East Asia Regional approach to MSDI are encouraging but feedback from these initiatives through RHC’s to the MSDIWG to enable it to assist and / or support such initiatives, is often limited or even missing. Much more could be done to encourage and coordinate the IHO approach.

### **1.4. The role of MSDIWG**

As a result of Decision 13 on Proposal 13 at the 4th EIHC: April 2007, the Marine Spatial Data Infrastructure (MSDI) Policy resolution was adopted. To deliver the IHO policy objectives, the MSDIWG was set up, initially as a sub group of the Hydrographic Services and Standards Committee (HSSC); formerly known as the Committee on Hydrographic Requirements for Information Systems (CHRIS). In early 2015, the MSDIWG became a sub group of the Inter-Regional Coordination Committee (IRCC) reflecting its predominantly non-technical coordination and support role working with the Regional Hydrographic Commissions (RHCs), to deliver its knowledge and wisdom to HO. Its terms of reference can be found on the IHO website.<sup>3</sup>

## 1.5 Some Significant SDI Policy Drivers

There are now many policies driving requirements for greater access to authoritative geospatial data across the world. Here are a few of the ones that have far reaching remits:

### 1.5.1. Blue Economy and Blue Growth

The concept of a "blue economy" came out of the 2012 Rio+20 Conference and emphasizes conservation and sustainable management, based on the premise that healthy ocean ecosystems are more productive and a must for sustainable ocean-based economies. To support a shift to this new approach, the UN Food and Agriculture Organisation (FAO) launched the Blue Growth Initiative, through which it will assist countries in developing and implementing blue economy and growth agendas.

The European Union developed its long term "blue growth" strategy to support sustainable growth in the marine and maritime sectors as a whole. Seas and oceans are drivers for the European economy and have great potential for innovation and growth. It is the maritime contribution to achieving the goals of the Europe 2020 strategy for *smart, sustainable and inclusive growth in European marine and maritime sectors*. The European blue economy currently represents roughly 5.4 million jobs and generates a gross added value of almost €500 billion a year. The MSDIWG is tracking this initiative and other similar ones across the World.

### 1.5.2. UN-GGIM

The United Nations initiative on Global Geospatial Information Management (UN-GGIM) is now playing a leading role in setting the agenda for *the development of global geospatial information and to promote its use to address key global challenges*. It provides a forum to liaise and coordinate among Member States, and between Member States and international organizations. The IHO has observer status at UN-GGIM the future role of its MS will be crucial to enabling the wider reach and use of HO data as part of the UN-GGIM Statement of Shared Principles<sup>4</sup> which includes the development of the global geodetic reference frame; adoption and implementation of standards by the global geospatial information community; determining fundamental data sets; developing a shared statement of principles on the management of geospatial information and setting up legal and policy frameworks related to authoritative data.

### 1.5.3. G8 Open Data Charter

In June 2013, the G8 Group of major economic nations signed the *Open Data Charter*<sup>5</sup>. We are witnessing the growth of a global movement facilitated by technology and social media and fuelled by information; with enormous potential to create more accountable, efficient, responsive and effective governments and businesses, and economic growth. The G8 principles have at their heart, the foundation for access to, and the release and re-use of

<sup>4</sup> <http://ggim.un.org/docs/statement%20of%20shared%20guiding%20principles%20flyer.pdf>

<sup>5</sup> <https://www.gov.uk/government/publications/open-data-charter/g8-open-data-charter-and-technical-annex>

data namely: open data by default<sup>6</sup>, improved data quality and quantity; data re-use by all and the release of data for improved governance and innovation.

#### 1.5.4. Emergency Planning and Response

The urgent need to develop and provide improved plans for responding to disasters and emergencies in the world's sea space has been highlighted by several high profile events in the last 5 years including: BP oil spill in Gulf of Mexico in Sep 2010<sup>7</sup>; the Japanese earthquake and tsunami in March 2011; the Korean ferry disaster in April 2014 and the loss of Malaysia Airlines flight MH370 in 2015. Reaction to each of these, and numerous other events, requires a multi-disciplinary approach including emergency response, environmental protection and longer term regional planning. Efforts are already underway to create an SDI framework for more effective Oil Spill Response with MSDIWG members working with stakeholders to enable this.

#### 1.5.5. Open Standards

Engagement and co-operation with the Open Geospatial Consortium (OGC) is extremely important to the HO community as evidenced by the creation of the OGC Marine Domain Working Group (MDWG) in 2015 and the development of an draft MOU between OGC and the IHO. OGC and ISO standards form the backbone of resilient data management and governance as well as MSDI. The HO community had been reluctant to engage, due in large part to it being product focused rather than process focused. This is now changing with the MDWG reinforcing the work on technical aspects of MSDI, which will release more capacity in the IHIO to concentrate on the other three important pillars of MSDI.

### **1.6. National HO's as Consumers of Data from Third Parties**

In undertaking their core remit, the majority of HOs utilise information from third parties. Examples include National Land Mapping and Cadastre Agencies (e.g. coastline, land features), Maritime Safety and Lighthouse Authorities (e.g. position and status of AtoNs) and National Licensing Authorities (e.g. submarine cables and pipelines). SDI allows HO's to exchange data more easily and effectively with third party data holders, thus improving efficiency and reducing the risk of data being inaccurate or out of date. Usually this data is provided as seamless layers. HO's that then manage this data at source are able to use it more effectively to create charting, for example, that is naturally harmonised thus realising greater benefits.

## **2. Challenges Hydrographic Offices face in engaging in MSDI**

### **2.1. The Current Focus on Products Supporting a Single Customer Group**

All HOs depend on data, but operate in terms of a products based approach (e.g. paper charts, sailing directions, tide tables) supplied to a specific navigational user community. The creation of ENC's requires chart information to be decomposed into features and attributes, but the output is

<sup>6</sup> Open does not always mean free-of-charge

<sup>7</sup> <https://www.oilspillresponse.com/technical-library/oil-spill-response-field-guide/>

still a generalized product, provided as data sets delivered on a cell-by-cell basis and characterized by scale. They are therefore restricted by design in their onward use. With the driving force aimed at navigational safety, any additional use is seen as an opportunistic spin-off. The opportunity to service a percentage of a much wider Geographic Information (GI) user community (reputed to be over 5 million) had seemed to have been overlooked but is now being considered and in some cases, activated.

## **2.2. Managing Business Risk**

HOs operate in a core navigational market where the pace of change is slow and deliberate, due in part to the Safety of Life at Sea (SOLAS) regulatory process at the IMO; the demographic profile of its core customer and also the pace of change in the HO community. Navigation is all about safety where the risk of things going wrong could ultimately, if its charts and publications are proven to be in error or missing vital information as a result of an incident, burden the government with unlimited costs. As a result there, the adoption of new ways of working has not been prioritised.

Adapting to new opportunities often presents a very significant challenge to the HO as it considers ways in which it might engage with a new and much larger user community. The fairly recent demand for access to marine and maritime geospatial data from commerce, government, academia and the citizen requires far less “warranty” in the HO data and information supplied so should present a less complex and risky proposition. However, processes may not be in place to enable this, such as a lack of a policy for re-use, provision of licences or its ability to receive money in return for data delivered and licensed. Without support and encouragement from the IHO, the argument for HO’s to move forward cannot always be easily made. However, MSDI can and will provide most of the information for charting in the future!

## **2.3. Innovation**

During capacity building training courses provided by MSDIWG expert contributors, it is heartening at how well, with a little persuasion and nurturing, students display inventiveness in thinking about products, services and systems that are clever, interesting, practical and potentially profitable. Whilst people can be good at innovating, few organisations have track records when it comes to implementing its own innovations. The paradox is that while we can systematise innovation up to a point, it is difficult to systematise the adoption of innovation. Innovation has not been a priority to HOs as until quite recently, they have been predominantly involved in producing paper charts and ENC products. However, HO’s do need to accelerate the process of innovating to keep abreast of changes in the way data is handled and published, the speed at which technology is developing and in the evolution in corporate governance models.

## **2.4. Breaking the paradigm of a fractured HO Governance Model**

HO core business has remained unchanged for many years. There is now a new imperative to modernise and overhaul production processes and workflows in spatial and business data management. Functional MSDI requires willingness and practical co-operation between the various organisations that create, share and use information to implement the overall policy.

There should also be a clearly defined governance structure, transparency in decision-making and reporting, to foster a shared sense of working towards a common goal.

In an organisation that has a culture of trust, transparent communication, involved and engaged employees and positive interpersonal relationships; resistance to change is easy to see and therefore much more likely to happen. Employees feel free to tell their line manager what they think and have open exchanges with managers. When a change is introduced in this environment, with discussion and employee involvement, resistance to doing things differently is minimized especially where there is a wide-spread belief that the change is needed and beneficial.

With the emergence of highly skilled, IT literate, motivated and questioning workforces that are keen to see innovation and change happen, HO's are at risk of not providing a platform whereby new ideas can be discussed, listened to and implemented. This is evident in the basic understanding and appreciation of the opportunities presented by data management best practise and MSDI. In all HO's, staff should be armed with the knowledge, training and skills to enable them to engage and participate in MSDI.

## **2.5. Learning from other Organisations and Coordinating Bodies**

There are several global organisations that already share and exchange data and / or submit their data to an SDI. Here are few examples that HO's should already know about:

### **2.5.1. IOC-IODE<sup>8</sup>**

The programme International Oceanographic Data and Information Exchange (IODE) of the Intergovernmental Oceanographic Commission (IOC) of UNESCO was established in 1961. Its purpose is to enhance marine research, exploitation and development, by facilitating the exchange of oceanographic data and information between participating Member States, and by meeting the needs of users for data and information products. During the past 50 years, IOC Member States have established over 80 oceanographic data centres. This network has been able to collect, control the quality of, and archive millions of ocean observations, and makes these available to Member States. With the advance of oceanography from a science dealing mostly with local processes to one that is also studying ocean basin and global processes, researchers depend critically on the availability of an international exchange system to provide data and information from all available sources. Additionally, scientists studying local processes benefit substantially from access to data collected by other Member States in their area of interest. The economic benefit of obtaining data by exchange as opposed to collecting it oneself is huge.

### **2.5.2. WMO<sup>9</sup>**

The World Meteorological Organisation (WMO), a specialized agency of the United Nations is the authoritative voice on the state and behaviour of the Earth's atmosphere, its interaction with the oceans, the climate it produces and the resulting distribution of water

<sup>8</sup> [http://www.iode.org/index.php?option=com\\_content&view=featured&Itemid=89](http://www.iode.org/index.php?option=com_content&view=featured&Itemid=89)

<sup>9</sup> [https://www.wmo.int/pages/about/index\\_en.html](https://www.wmo.int/pages/about/index_en.html)

resources. WMO has a membership of 191 Member States and Territories (on 1 January 2013). It originated from the International Meteorological Organization (IMO), which was founded in 1873. Established in 1950, WMO became the specialized agency of the United Nations in 1951 for meteorology (weather and climate), operational hydrology and related geophysical sciences. As weather, climate and the water cycles know no national boundaries, international cooperation at a global scale is essential for the development of meteorology and operational hydrology. The WMO provides the framework for such international cooperation.

### 2.5.3. The WDC for Geophysics and Marine Geology<sup>10</sup>

The World Data Centre (WDC) for Geophysics and Marine Geology, in Boulder USA, is operated by, the National Geophysical Data Centre (NGDC). It manages all types of data from the ocean floor including descriptions and analyses of seafloor samples, deep drilling data, geophysical measurements, and derived gridded data sets including total sediment thickness of the world oceans. Other data types include coastlines and plate boundaries.

Geophysical data include bathymetry, gravity, and magnetics, and single-channel and multi-channel sub-bottom profiles collected on more than 4,000 oceanographic surveys covering millions of kilometres of the world's oceans. Geological data are available for over one hundred thousand cores, grabs, dredges, and drill samples covering most of the world's oceans. Data are contributed by sources from around the world and were originally collected for a variety of purposes, including academic research, international and interdisciplinary scientific projects, commercial mineral resource evaluations, defence, and government environmental baseline studies.

## 3. Making MSDI a Reality

Since its inception in 2007, the MSDIWG has focused on building a body of knowledge<sup>11</sup> about MSDI and how HO's can make the journey of change in the way it manages data, information, workflows and its people. Ten years on, with progress slower than expected; the need to adapt has become more acute. HO's need to develop a greater understanding of the importance of data and information provision, sharing and publishing as well as how that data and information can be used in an MSDI.

It is a well-known fact that investment in hydrography is reducing across the world and this trend is likely to continue as long as HO's struggle to respond to the needs of government, commerce and even the citizen. There is a real risk that budgets could potentially be re-directed to other in-country government departments for them to provide the data and information services the wider user community now require. This situation could also happen in the HO core navigation market where real time inertial systems, coupled with e-navigation services may in time supersede the role provided by charts.

<sup>10</sup> <http://www.ukssdc.ac.uk/wdc/usa/mgg.html>

<sup>11</sup> [http://www.iho.int/mtg\\_docs/com\\_wg/MSDIWG/MSDIWG\\_Misc/MSDIWG-BOK.html](http://www.iho.int/mtg_docs/com_wg/MSDIWG/MSDIWG_Misc/MSDIWG-BOK.html)

Engagement in MSDI is one important approach to being able to meet the emerging challenges so HO should create innovative ways to address the challenges and secure their futures. Developing the will “to succeed” in supplying authoritative foundational marine data and information is absolutely vital, given a backdrop of uncertainty in the HO community and in the geospatial world globally. So how might HOs adapt?

### **3.1. Realise that HO Data is a National and Global Asset**

Data are the second most important asset in an organisation after the people it employs! Data therefore needs to be treated as an enterprise wide, national and even global asset. Data is now often referred to as the “new oil” or the “new electricity” and as such has tremendous intrinsic value not only to the organisation that captures and holds it but to other potential users as well. In the maritime sector, we have been promoting the term “collect once, use many times” for many years in respect of the wider value and utility of, for example, bathymetry data. But there are other important data held by the HO that has additional or residual value once it has been used to support the core business of charting.

### **3.2. Become Data Centric**

The principle of data being the foundation of knowledge is well known. In essence, knowledge is only of value if conveyed from a broad base of data delivering a smaller volume of knowledge. The conversion of detailed bathymetric surveys into charts with sparse soundings, is a good example of this. A large amount of data is collected, and although it presents a lot of information to a chart compiler, only a small amount (sufficient to permit safe navigation) of the knowledge is passed on to the recipient of the charting product. Thus, knowledge transfer is only a small part of the potential of the original data. Holding data wrapped in products does not allow such freedom, as it is very expensive to backward and / or re-engineer.

MSDI is the combination of a variety of data types at different resolution data, allowing efficient analyses by a wide range of disciplines, such as maritime spatial planning, environmental management and emergency response. This requires the data to be held in a generic way, rather than for a particular product for a limited user group or for a specific purpose. Managing data as close to its “source” manner as possible in a “data centric” way provides a greater opportunity for it to be re-purposed for greater re-use.

### **3.3. Engage with Other Relevant Stakeholders in the Geospatial World**

#### **3.3.1. Other Data Providers**

HOs should not act in isolation, but interact with other bodies providing geospatial data. A good example is the role of National Land Survey and Mapping Agencies (NMAs) that are responsible for mapping the terrestrial world to the Mean High Water Line (MHWL) and below that where land generated structures extend into the littoral zone. The provision of interoperable data provided jointly by the NMA and HO across this space in the form of a seamless digital elevation models are of significant value to coastal planners, engineers and surveyors.

Other important data providers are National Geological Agencies. HO's collect bathymetry data, the depth values of which are critical to its core business. However, most modern survey instruments provide a "by-product" called "backscatter" which defines the seabed form and texture. Whilst of limited interest and value to HO's for charting but is of great value to geologists and geophysicists.

### 3.3.2. Standards Bodies [OGC; ISO; IHO]

A key pillar of MSDI is standards. Standards are an agreed, repeatable way of doing something and are used consistently as a rule, guideline, or definition. Standards make life simpler, increasing the reliability and the effectiveness of many products and services we use. Standards are designed for voluntary use and do not impose any regulations. We cannot operate without them, whether they are there to provide a framework for hydrographic data collection (IHO S-44); metadata (ISO19115) or the IHO Universal Hydrographic Data Model (S-100) enabler for data sharing across multi-disciplinary groups making the use of hydrographic data easier. The Open Geospatial Consortia (OGC), with whom IHO interacts, develops de-facto standards that are tested in the real world and adopted by consensus by users often becoming de-jure in nature through adoption by the International Standards Organisation (ISO).

### 3.3.3. Users

Engagement in MSDI should involve users; government, commerce, academia and the citizen to whom HO's will ultimately be supplying data. By understanding their needs, HO's will be better able to deliver fit-for-purpose data either directly or through an enterprise, national or regional MSDI.

## **3.4. Education and Training**

Education, training, mentoring and coaching (including capacity building training) is available to better enable HO's to understand data management challenges and to ensure they are able to implement significant and sometimes difficult changes. The IHO through the MSDIWG provides syllabi for a selection of training courses on subjects such as Data Management "Best Practise" and MSDI; Fundamentals of MSDI, Data Management Awareness to practitioners, middle managers, directors and senior executives. Ranging from half-day briefing sessions; one-day courses on data management policy and strategic objectives to five-day courses on MSDI and data management which include practical exercises about making MSDI a reality; such training is available to all RHC's not just those that qualify for capacity building funds. They are also available to individual HO's willing to sponsor such training independently of CBSC funding.

## 4. Celebrating our Strengths

Despite the challenges facing the HO community, there have been some notable successes:

### 4.1. Building a Body of Knowledge

The IHO has developed a significant body of knowledge about SDI, MSDI and data management best practise from around the world over the last ten years. This body of knowledge resides on the IHO website<sup>12</sup>.

A new IHO special publication C-17 entitled Spatial Data Infrastructures - "The Marine Dimension" (Guidance for Hydrographic Offices) was published in 2008 and subsequently revised in 2011. This document has recently been significantly revised again to ensure its messages remain current and relevant to in MSDI developments across the world. It is available as a published document as well as being available in a web format. MSDIWG Expert Contributors, co-authored a White Paper in 2010 entitled: "The Hydrographic and Oceanographic Dimension to Marine Spatial Data Infrastructure - developing the capability". This document has been widely circulated at training events, conferences and RHCs. A new White Paper was published in late 2016 to providing a refreshed promotional view of MSDI to the reader.

Material has been uploaded to the MSDIWG website detailing the syllabi for Data Management and MSDI training and/or capacity building courses ranging from half-day short briefings to one-week intensive courses including practical applications. E-Learning is now being developed to allow MS to learn remotely from material available on the key elements of MSDI and its constituent parts.

The body of knowledge plus web-links is a good way of placing MSDI information before HOs and wider stakeholder communities to enable them to identify the steps necessary and the benefits and the wider opportunities to be derived from MSDI. There are links to case study examples for existing or emergent SDI initiatives in the MSDIWG part of the IHO website.

### 4.2. Global Engagement

IHO and the MSDIWG interact with the European Commission (EC) DG Mare and EMODnet to monitor the implications of EC Directives (such as the recent Marine Spatial Planning Directive of 2014) on the work of HO's. It also has discussions with the EC Joint Research Centre (JRC) to monitor, and provide inputs to, the Infrastructure for Spatial Information in Europe (INSPIRE) Directive. It is important the European MS comply fully with its implementation by 2019.

IHO MSDIWG meets annually. It has hosted meetings in Monaco (2008 and 2009); Copenhagen; Denmark (2013), Silver Spring, Maryland, USA (2014); London, UK (2015), Tokyo, Japan (2016) and Vancouver, Canada in early 2017.

WG meetings since 2014 have been preceded by a one-day Open Forum, to which invited in-country and visiting government, academic and commercial experts share their experiences about SDI and related topics. In a further development in 2016, the Japanese Coast Guard (JCG)

---

<sup>12</sup> [http://www.iho.int/mtg\\_docs/com\\_wg/MSDIWG/MSDIWG\\_Misc/MSDIWG-BOK.html](http://www.iho.int/mtg_docs/com_wg/MSDIWG/MSDIWG_Misc/MSDIWG-BOK.html)

facilitated a Demonstration workshop at which expert contributors to the MSDIWG were able to demonstrate their software, workflow efficiency tools, data management and training services specifically provided to assist MS. Both of these events were very well attended and were deemed to be a great success.

IHO is currently an observer at UN-GGIM but it is expected that its status will be heightened as the “marine and maritime” domain comes under the global spotlight. IHB provides briefs to the MSDIWG on activities of interest.

#### **4.3. Standards Management**

The MSDIWG has invited representatives from the OGC to its last three working group meetings. OGC, through its Maritime Domain Working Group (MDWG) group convened in June 2016 in Dublin, OGC is now working with the MSDIWG to develop a candidate specification for MSDI. As a result a DWG has been set up to develop this specification that will bring together a family of best practise standards relevant to the IHO role within an MSDI.

#### **4.4. Regional Communication and Co-operation Across Borders**

In the last three years, the MSDIWG has witnessed, through a combination of RHC sponsored capacity building training courses, and the debate and discussion taking place in MSDIWG annual meetings, offline communications and through access to its body of knowledge; that HOs in some RHCs are now beginning to discuss the opportunities to engage in MSDI at the enterprise and national level. It is now apparent that some nations are now actively discussing cross-border cooperation in the provision of data as part of regional initiatives. Whilst still very new, these are encouraging signs with HOs willing and able to share their experiences in open fora.

#### **4.5. Capacity Building Training and Coaching**

RHCs, through the CBSC, has delivered 5-day Capacity Building training courses to practitioners and managers in Data Management and MSDI with over 100 students successfully completing the courses between 2010 and 2016. Each course covers the four main pillars of MSDI namely, ICT, Content, Standards and Policy/Governance. All students complete an end-of-course assessment with the results passed to the sponsoring RHC and IHB. Additionally, MSDIWG Expert Contributors delivered half day Data Management and MSDI Awareness courses as part of RHC meetings in Mexico (as part of MACHC in 2014) and Tanzania (as part of SAIHC in 2015).

Through investment in such training, we are now seeing the benefits realised with emergent MSDI capability in East Asia and Indian Ocean regions being coordinated or managed by ex-students! We have to realise that not all RHCs are yet taking advantage of such training despite an opportunity for them do so! CBSC has sponsored courses in six RHC's to date. It is timely for all RHC's to either consider applying for funding to CBSC to enable MSDI training to take place or simply sponsor a course themselves in their own region.

## 5. The proposal to the 1<sup>st</sup> Session of the IHO Assembly

The IHO Marine Spatial Data Infrastructure Working Group (MSDIWG) proposal requests that IHO Assembly commits to strengthening the mandate of the MSDIWG for a further ten years and acknowledges the changing landscape in which HOs are likely to be operating.

- 5.1. The IHO should continue to support Member States in the identification, development and implementation of an appropriate role in national Spatial Data Infrastructure (SDI) and MSDI initiatives by strengthening the mandate of the IHO MSDIWG. This will be achieved through:
  - 5.1.1. Developing further the MSDI capacity building framework comprising knowledge transfer, training and mentoring noting the need for all Member States to be sufficiently educated in MSDI and energizing the latest generation workforce to support and lead this process.
  - 5.1.2. Continuous updating Special Publication C-17 procedural guide to reflect progress made, whilst identifying ongoing challenges, and providing a clear pathway to successful engagement of the national hydrographic authority in MSDI.
  - 5.1.3. Publishing White Papers and Case Studies in a timely manner to illustrate the value and benefit of MSDI and data management “best practice” governance and procedures.
  - 5.1.4. Managing the IHO web-based facility by growing its body of knowledge to further stimulate knowledge transfer, development of best practice workflows and data management through the provision of online guidance and training material.
  - 5.1.5. Strengthening existing and develop new relationships between IHO and SDI stakeholder groups and, through active participation in these groups, grow further the understanding and knowledge of the role of hydrography in MSD and NSDI.
- 5.2. Support the work of the IHO/RHCs/MDSIWG by recognizing the wider use of hydrographic data and by encouraging the publication of harmonised reference datasets in national, regional and global initiatives.
- 5.3. Support the work of the IHO MSDIWG to deliver outreach initiatives and provide a budget to do so.

## 6. Recommendation

The IHO Assembly is requested to:

- 1) Acknowledge what has been achieved by the MSDIWG since 2008.
- 2) Decide on an appropriate revision of the IHO resolution as stated in paragraph 5.
- 3) Task the IRCC to continue to oversee the role of the MSDIWG and its revised action plan and in doing so, endorse the IHO stance in promoting and facilitating the modernisation of the HO community to ensure it remains fit for purpose and relevant, not only in supporting navigation, but to the wider marine and maritime world.

**Annex 1****Decision 13, Proposal 13 from the 4<sup>th</sup> EIHC: April 2007**

The 4th EIHC adopted the proposed Resolution as follows:

**A1.xx Marine Spatial Data Infrastructure (MSDI) Policy**

1. The IHO will support Member States in the identification, development and implementation of an appropriate role in national Spatial Data Infrastructure (SDI) and MSDI initiatives. This will be achieved through:
  - a. The development and maintenance of a Special Publication that will provide a definitive procedural guide to establishing the role of the national hydrographic authority in MSDI.
  - b. Developing an MSDI capacity building plan comprising knowledge transfer and training to Member States.
  - c. Developing and managing a web-based facility to encourage knowledge transfer, best practice and provision of online guidance and training material.
  - d. Formalizing relations between IHO and other SDI stakeholder groups and through actively participating in these groups to strengthen understanding and knowledge of the role of hydrography in MSDI.
2. IHO Regional Hydrographic Commissions are encouraged to monitor and report progress in Member States' MSDI engagement and development as a means of benchmarking the role of the national hydrographic authority in MSDI.
