### UNDERSEA FEATURE NAME PROPOSAL

(Sea NOTE overleaf)

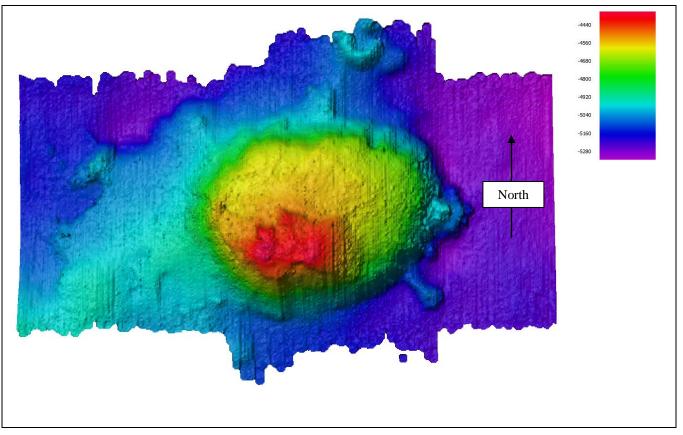

Note: The boxes will expand as you fill the form.

 Name Proposed:
 Ffynnon Garw Hill
 Ocean or Sea:
 Central Pacific

 The proposer offers SCUFN/IHO the option to apply a name from their list of available names to be applied to the feature should that deem one suitable.
 The proposer offers to be applied to the feature should that deem one suitable.

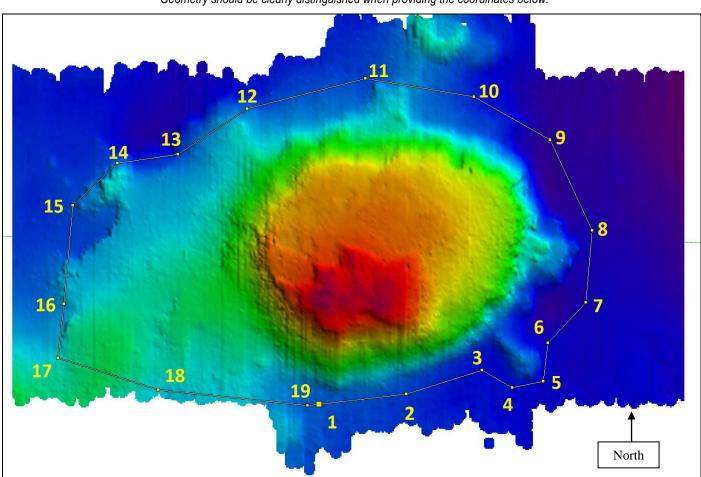

<u>Above</u>: 3D rendering of the proposed *Ffynnon Garw Hill* feature detailed in the following proposal [Fledermaus] [Supporting image 001.png]

Above: Plan view of proposed Ffynnon Garw Hill feature [Fledermaus]

### [Supporting image 002.tif]

Geometry that best defines the feature (Yes/No) :									
Point	Line	Polygon	Multiple points	Multiple lines*	Multiple polygons*	Combination of geometries*			
		Yes							

\* Geometry should be clearly distinguished when providing the coordinates below.

<u>Above</u>: Boundary perimeter of the proposed Ffynnon Garw Hill with 19 points. Lat/Lon of individual points is given in the following table [Caris] [Supporting image 003.png]

Reason for Choice of Name (if a person, state how	The proposer offers the IHO/SCUFN to affix it's own name to this feature if they have any deemed appropriate for this purpouse.
associated with the feature to be named):	The name <b><i>Ffynnon Garw</i></b> is a fictional hill in the story <i>The Englishman Who Went Up a Hill But Came Down a Mountain</i> by Christopher Monger. A description of the reason for the choice is given below.
	The proposed feature included in this submission was used as a training exercise for our students participating in science expedition FK160115 (Mak Saito –Woods Hole Oceanographic Institute) onboard the Research Vessel <i>Falkor</i> operated by Schmidt Ocean Institute
	This training gave the students a basic understanding of the process of naming a seabed feature and preparing the relevant documentation.
	The process of preparing a submission to SCUFN is a good learning experience as it teaches the students to use all the available software tools (Caris, Fladermaus, FMGT and Qimera) to create a structured product that comprises of profiles, contour plots, 3d images and other necessary documentation to support a submission. The deliverables required for a submission are not standard products that the students normally produce and this exercise had them thinking beyond the normal gridded plot they are tasked with making
	Having processed the raw multibeam data the next step is for the student to apply the actual guidelines to define the type of feature. (STANDARDIZATION OF UNDERSEA FEATURE NAMES GUIDELINES PROPOSAL FORM TERMINOLOGY Publication B-6 Edition 4.1.0, September 2013)
	The students naturally assumed that because a feature appears large in size it is automatically a <i>Seamount</i> . Many assumed that because this feature would be classified as mountain on land it would similarly class as a mountain below the waves. The definition of a terrestrial mountain varies between the nationalities of those undertaking the exercise. For example in the UK the definition of mountain has always been a bit vague and modern legislation requires it to have an elevation of 600m (2000ft). For a short period the US

<ul> <li>applied the term Mountain to anything over 1000ft.</li> <li>The feature covered by this submission has a relief of 936m. The definition of a seamount as included in B-6 Edition 4.1.0 is "A distinct generally equidimensional elevation greater than 1000m above the surrounding relief as measured from the deepest isobath that surrounds most of the feature."</li> <li>The students were disappointed that after processing the raw data and creating the products the feature's relief fell short thus it did not qualify as a seamount.</li> <li>The height of the feature more accurately fits the definition of a hill. In publication B-6 Edition 4.1.0 a hill is defined as "A distinct elevation generally of irregular shape, less than 1000m above the surrounding relief as measured from the deepest isobath that surrounds most of the feature."</li> <li>One of the students' jokingly suggested that we add a bump to the feature and thus make it a seamount instead of a hill as nobody would be coming out here to verify the data anytime scon.</li> <li>The debate as to whether this was a hill or a seamount coupled with the suggestion from the student was very similar to the plot line of the film "The Englishman Who Went Up a Hill But Came Down a Mountain"</li> <li>The story (also made into a film) is set in 1917, English surveyors Reginald and George arrive in a small Welsh town to calculate the precise status of Ffynnon Garw, proudly described by the locals as "the first mountain in Wales". Unfortunately, Ffynnon Garw so found to be somewhat short of the requisite 1000 feet. This results in a less than efficient a seamount and each time it fiell within the definition of hill.</li> <li>Based on this we decided to adapt the name Ffynnon Garw Hill as a reminder of the debate and the definition of a hill vs a seamount.</li> <li>The students measured the feature from multiple angles to figure out if there was any way this feature could actually be a seamount.</li> <li>Ffynnon Garw Hillin "The Englishman Who Went Up a Hill But Came Do</li></ul>	
<ul> <li>as included in B-6 Edition 4.1.0 is ": A distinct generally equidimensional elevation greater than 1000m above the surrounding relief as measured from the deepest isobath that surrounds most of the feature."</li> <li>The students were disappointed that after processing the raw data and creating the products the feature is relief fell short thus it did not qualify as a seamount.</li> <li>The height of the feature accurately fits the definition of a hill. In publication <b>B-6</b> Edition 4.1.0 a hill is defined as "A distinct elevation generally of irregular shape, less than 1000m above the surrounding relief as measured from the deepest isobath that surrounds most of the feature."</li> <li>One of the students' jokingly suggested that we add a bump to the feature and thus make it a seamount instead of a hill as nobody would be coming out here to verify the data anytime soon.</li> <li>The debate as to whether this was a hill or a seamount coupled with the suggestion from the student was very similar to the plot line of the film "The Englishman Who Went Up a Hill But Came Down a Mountain"</li> <li>The story (also made into a film) is set in 1917, English surveyors Reginald and George arrive in a small Welsh town to calculate the precise status of Ffynnon Garw, proudly described by the locals as "the first mountain in Wales". Unfortunately, Ffynnon Garw s found to be somewhat short of the requisite 1000 feet. This results in a less than ethical attempt by the locals to increase the height of the mountain by building a large earth cairn, and then persuade the surveyors to measure it again.</li> <li>The students measured the feature from multiple angles to figure out if there was any way this feature could actually be a seamount.</li> <li><i>Ffynnon Garw Hillin "The Englishman Who Went Up a Hill But Came Down a Mountain"</i> is loosely based on Garth Hill (usually called The Garth, or Garth Mountain, Mynydd y Garth in Welsh. Unfortunately, <b>Ffynnon Garw</b> s found to be somewhat short of the requisite 1000 feet. This results in a less than ethical attempt by the locals to increase the height of the mountain by building a large earth cairn, and then persuade the surveyors to measure it again. The students measured the feature from multiple angles to figure out if there was any way this feature could actually be a seamount and each time it fell within the definition of hill. Based on this we decided to adapt the name <b>Ffynnon Garw Hill</b> as a reminder of the debate and the definition of a hill vs a seamount. <b>Ffynnon Garw Hillin</b> " <i>The Englishman Who Went Up a Hill But Came Down a Mountain</i> " is loosely based on Garth Hill (usually called The Garth, or Garth Mountain, Mynydd y Garth in Welsh. The hill is situated North of Cardiff and has a number of Bronze age mounds (turnuli) atop the hill. These mounds push the total relief of the hill over 1000ft which many considered made it a mountain.	a seamount instead of a hill as nobody would be coming out here to verify the data anytime
<ul> <li>arrive in a small Welsh town to calculate the precise status of Ffynnon Garw, proudly described by the locals as "the first mountain in Wales". 	Discovery Date:	23 <sup>rd</sup> January 2016
Diagovory Fasta	Discoverer (Individual, Ship):	Leighton Rolley (Hydrographer) –
Discovery Facts:		(Employee of Schmidt Ocean Institute)
		Onboard Research Vessel Falkor

The discovery of the proposed **Ffynnon Garw Hill** occurred during RV *Falkor* science cruise FK160115 departing Honolulu, Hawaii on the 17<sup>th</sup> November 2016 and arriving in Tahiti on the 11th February 2016.

This was primarily a physical oceanography cruise studying Oxygen Minimum Zones (a detailed overview from the cruise proposal is given below). This involved the deployment of standard Seabird CTD in addition to a Trace Metal Rosette, Pumps, Net Tows and several Argo floats. As part of Schmidt Ocean Institutes drive to collect additional datasets for the community the multibeam systems was run continuously throughout to cruise from Honolulu to Tahiti by Lead Marine Technician Leigthon Rolley and Marine Technician Veit Huehnerbach. During this time multibeam acquisition and processing training was given to student members of the science party to enhance their core skills

### **Cruise Overview**

The oxygen minimum zones (OMZs) of the oceans are critical chemical reactors involved in the cycling of carbon and nitrogen in the oceans and atmosphere. Recent studies have discovered that these regions are undergoing a significant expansion due to climate change. Marine microbial populations have a fundamental role in carbon and nitrogen cycle transformations, yet most of our knowledge of marine microbes comes from the sunlit surface that represents 1% of the total ocean volume, while the microbes in the ocean's interior remains enigmatic. We propose to conduct a field program connecting a suite of biochemical, microbiological, and chemical measurements in the Eastern Tropical North Pacific Ocean to characterize these key biogeochemical processes. Newly developed biomedical quantitative proteomics capabilities would be deployed that directly measure the microbial enzymes conducting key reactions for the first time. This direct detection would allow a diagnostic capability to assess the location and extent of important microbial reactions and would be coupled with chemical rate (nitrogen and mercury species) and nucleic acid analyses of microbial populations. Together this study would provide an important analysis of these natural chemical reactors and lay the foundation for assessing their response to ongoing environmental change. Our expedition track from Hawaii to Tahiti will traverse the oxygen minimum waters that extend from the Eastern Tropical North Pacific. We will sample the mesopelagic for metalloenzymes and biogeochemical parameters (nutrients, nitrogen cycle reaction rates, oxygen, nitrous oxide) and microbial diversity.

# The multibeam line incorporating the the proposed *Ffynnon Garw Hill* feature is Line 0117 and Line 0118
