SNPWG11-8.4

Example: Convert "Sailing Directions of JHOD" to SNPWG model

1. Comment (See appendix)

(1) The test data of SNPWG model is lengthy sentence to display on ECDIS. (Example pltrqs)

　　We need to exchange know-how to solve this problem.

(2) Because image data is not contained in the object of the feature catalog, users don't understand easily. (Example NPLDST)

　　We should talk with TSMAD on a linkage of text data and image data.

(3) There is no classification code that corresponds to the items of the Sailing Directions in category ID related to the attribute of the feature catalog. (Example catvsl)

　　We prefer to add measures to render the attribution in plain words.

2. Proposal (See appendix)

(1) Try to simplify the contents of the Sailing directions for display on ECDIS.

(2) Not only the sentences but also the image data should be added to the content of the object in the future catalog.

(3) "Others" should be added to existing ID and the details should be described in plain words.
