

EFFICIENSAEA Project

” EfficienSea is an Interreg project aiming at improving the Baltic Sea with focus on the environment and the safety of navigation. EfficienSea has a budget of close to 8 million Euro, gathering 16 partners from six countries around the Baltic Sea. The project has 5 workpackages.

One of the most important work packages is e-Navigation. Modern technology on the vessel bridge provides a lot of information that is supposed to help the navigator. Some of the information is however, unorganized, and standards are lacking. This can cause confusion. The possible overflow of information on the bridge can lead to accidents. With e-Navigation a new standard for organizing the information is being developed, providing for better means of navigation. One system integrates all the necessary information to give the right information at the right time, filtering out anything that is irrelevant for safe navigation. e-Navigation is an evolutionary and dynamic concept that will continue to develop as new user needs arise and emerging technological opportunities become available. “

Denmark would like NHC to note the information found in the briefing.
